Thank you for purchasing the ProtoThrottle.

Our goal was to design and develop a wireless throttle that provides the diesel modeler with the most realistic experience operating their model locomotives.

The ProtoThrottle mimics a standard EMD control stand including full detent throttle and reverser handles, a spring-loaded horn handle, a push-on/push-off bell button, and fully programmable front and rear headlights with a setting for ditch lights. In addition, the ProtoThrottle comes with a robust faceplate machined from aluminum, including prototype bezels, and anodized to give the look and feel of a real control stand.

The ProtoThrottle comes with our commitment to your satisfaction. We warranty the throttle from manufacturing defects for one year, and if you should have any questions or issues with the ProtoThrottle, please contact us.

The ProtoThrottle is powered by 2 AA batteries (not included). The batteries can be alkaline or rechargeable NiMH.

To access the battery holder, unscrew the 4 phillips head screws on the corners of the throttle’s faceplate; remove the box; IMPORTANT: when removing the batteries from the holder, use one hand to hold both sides of the holder to prevent it from bending away from the printed circuit board; insert batteries and reattach the box. Do not over tighten the screws.

To conserve battery life: make sure the throttle handle is in “idle” position and the reverser handle is in “centered” position when not in use. This will cause the throttle to go to sleep after 5 minutes.
Quick Start Guide

The ProtoThrottle will work with any scale and with sound- or non-sound decoders (though using sound enhances the control stand experience significantly). Any DCC decoder compatible with the NMRA standards will work with the ProtoThrottle because it uses standard DCC commands and functions via your command station. The ProtoThrottle is not a DCC system and will not replace the system you use.

Check the Iowa Scaled Engineering website for the most current list of supported DCC command stations: [www.iascaled.com](http://www.iascaled.com)

1. Configure your ProtoThrottle receiver using the instructions provided with the receiver.
2. Make sure the base address of the ProtoThrottle matches that of the receiver. (See page 18.)
3. If using multiple ProtoThrottles, set each throttle to a unique ID. (See page 18.)

Using your DCC system, set acceleration momentum (CV3) mid-range to moderately high so that the ProtoThrottle will need to “notch up” to get the train moving.

Set deceleration momentum (CV4) high or maximum. This will allow the train to “coast” when the throttle is in the idle position requiring the use of the brake to slow or stop the train.

Input the locomotive number into the ProtoThrottle:

1. Click the Menu button 5 times
2. Click the Select button once
3. Use the Up and Down buttons to change numbers

NOTE: the ProtoThrottle function settings are set to standard DCC function numbers by default. If you need to change any function number, the steps are explained below:

To check or set the horn, bell, and brake function numbers:

1. Click the Menu button 7 times
2. Click the Select button once
3. Click the Up or Down button to change the function number

NOTE: see page 10 for how to set a short (primary) address.

4. Click Menu button to toggle through the other function choices. Repeat step 3 to change additional function numbers.

Enjoy operating your locomotive!

*Please read the entire manual to familiarize yourself with all the features of the ProtoThrottle.* See our website for more specific instructions on programming lights and our future tonnage feature.

In addition, our website has detailed operational scenarios developed by professional locomotive engineer, Tim Garland. If you are not familiar with prototype operation from an engineer’s perspective, Tim’s scenarios will give you insight on how to operate more realistically using the ProtoThrottle.

**POWER DOWN**

Click “down button” to turn off throttle

- Advance to Engine Menu
- Toggle backlight on/off; hold to power down throttle

**NOTE:** these buttons can be assigned a function using the Configure Function menu

**www.protothrottle.com**
**DESCRIPTION**

The behavior of the Engine menu depends on the configuration of the **ENG ON** and **ENG STOP** settings in the Configure Function menu. For DCC decoders that take a single function on/off to turn the prime mover on/off (such as ESU Loksound or TCS WOSSound decoders), configure **ENG ON** to that function number and set **ENG STOP** to off (F--). The Engine menu will then change between OFF and ON when pressing the Up and Down buttons.

If a decoder is edge triggered instead (requires a function on/off transition) to turn the prime mover on and off (such as Soundtraxx Tsunami2), set both **ENG ON** and **ENG STOP** to the appropriate function numbers. In this case, the Engine menu will display STARTING and STOPPING between the ON and OFF settings as the assigned functions are sent to the locomotive decoder.

If the throttle is not in idle when attempting to turn off the prime mover, a warning will be displayed and the **ENG STOP** function will not be sent. Move the throttle back to idle to continue.

**Example #1**, F8 for ESU Loksound or F12 for TCS WOSSound:

**ENG ON** = F08  **ENG ON** = F12
**ENG STOP** = F-- **ENG STOP** = F--

**Example #2**, F5 (on, RPM+) and F6 (off, RPM-) for Soundtraxx Tsunami 2:

**ENG ON** = F05
**ENG STOP** = F06

---

**Advance to Tonnage Menu**

**Return to Main Screen**

**Start or turn on prime mover**

**Stop or turn off prime mover**

Note: the tonnage feature is a future release. Watch our website for updates.
Load / Save Configuration Menus

LOAD CNF: Advance to SAVE CNF
SAVE CNF: Advance to Set Locomotive Menu

Load selected configuration (and return to Main Screen) or
Save current configuration (and return to Main Screen)

LCD Screen

- Increase configuration number
- Decrease configuration number

Load / Save Configuration Sub-Menu

LOAD CNF
01: 0250

SAVE CNF
01: 0250

01: Configuration Number. Up to 20 distinct configurations (locomotive address, function mappings, throttle notch settings, options) can be stored in the ProtoThrottle and loaded quickly using this menu.

0250: Locomotive Address. This is the locomotive address associated with the selected configuration number.

Save Configuration screen saves the current loaded configuration (with any changes you’ve made) into whatever configuration slot is on the screen. In order to copy an established configuration, you must load it into the throttle first before “saving” it to another slot.

Both the Load Configuration and Save Configuration functions will ask you to confirm before executing by pressing the Down button. To cancel, click the Menu button.
## Set Locomotive Menu

Variable Brake. When set to ON, the brake effect will be proportional to the brake handle position. It is recommended to disable the emergency brake when variable braking is enabled. When set to OFF, the brake will be a simple on/off function.

Brake type:
- PULSE braking
- STEP braking (works with TCS WOWSound function)

Pulse braking. The brake function will be pulsed at a duty cycle corresponding to the brake handle position, simulating varying amounts of braking force.

Step braking. This feature is for use with TCS WOWSound decoders only. As the brake handle is moved to the right, a greater percentage of the brake is applied.

NOTE: the only way to disengage the brake is to fully release the brake handle completely to the left. Also, the emergency brake feature must be disabled for step braking to work correctly.

Continued on next page
**Brake Pulse Rate**

This sets the rate (0.2 - 1.0 second) at which brake commands are sent during pulse braking. A smaller value results in smoother braking but can result in a less responsive DCC system due to more commands being sent on the throttle bus.

**E-Stop on Brake Handle.** When set to ON, the brake handle can set emergency stop for the selected locomotive when moved completely to the right. When set to OFF, the brake handle will not cause an emergency stop to be set.

**Reverser Swap.** When set to ON, the reverser directions are swapped. This can be used to correct for a locomotive whose direction is set incorrectly or when changing the leading end of a back-to-back consist. When set to OFF, the reverser directions are normal.

Open Design
Iowa Scaled Engineering is committed to creating open designs that users are free to build, modify, adapt, improve, and share with others.

Hardware
The design of the ProtoThrottle hardware is open source hardware, and is made available under the terms of the Creative Commons Attribution-Share Alike v3.0 license, a copy of which is available from: http://creativecommons.org/licenses/by-sa/3.0/

Design files can be found on the Iowa Scaled Engineering’s Github site: https://github.com/IowaScaledEngineering/mrbw-cst

Firmware
The official Iowa Scaled Engineering firmware for the ProtoThrottle is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 3 of the License, or (at your option) any later version. A copy of the GNU GPL can be found at: http://www.gnu.org/licenses/gpl.html

New firmware can be flashed into the ProtoThrottle through J2. The six pins are a standard AVR 6-pin ISCP programmer connection.

We encourage you to join the ProtoThrottle group forum: https://groups.io/g/ProtoThrottle
The forum will help with general and technical questions regarding the ProtoThrottle.

Visit the Iowa Scaled Engineering website to learn more about our full line of model railroad electronics.

Contains FCC ID: OUR-XBEEPRO
This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Note: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Changes or modification to the device could void the user’s authority to operate the equipment.

Contains Model XBee-PRO Radio, IC: 4214A-XBEEPRO
This device complies with Industry Canada’s licence-exempt RSSs. Operation is subject to the following two conditions:
(1) This device may not cause interference; and
(2) This device must accept any interference, including interference that may cause undesired operation of the device.

Cet appareil est conforme aux RSS exempts de licence d’Industrie Canada. L’opération est soumise aux deux conditions suivantes :
(1) Cet appareil ne doit pas causer d’interférences; et
(2) Cet appareil doit accepter toute interférence, y compris les interférences susceptibles de provoquer un fonctionnement indésirable de l’appareil.

Changes or modification to the device could void the user’s authority to operate the equipment.
Des changements ou des modifications à l’appareil pourraient annuler l’autorité de l’utilisateur à utiliser l’équipement.
